SMARTBUSINESS SOLUTIONS

Unified RAG Knowledge Base

Client System Overview + Clock In / Clock Out User Manual

Purpose

This document consolidates the two supplied source documents into one reference for a retrieval-augmented generation (RAG) chatbot. It covers the platform, users and permissions, check printing, time and attendance, administrator and employee tasks, troubleshooting, data protection, onboarding, and confirmed scope limitations.

Prepared: 23 October 2026

Source handling: Information below is based on the two supplied documents. Unspecified client policies, deployment status, and implementation details are explicitly left unconfirmed rather than guessed.

PART 1 — CLIENT SYSTEM OVERVIEW

Source: CLIENT_SYSTEM_OVERVIEW.docx

SmartBusiness Solutions

Client System Overview

Prepared: 23 October 2026

Purpose: Explain the system’s components, user journeys, and handling of business data in clear, non-technical terms.

1. What the system does

SmartBusiness Solutions is a business platform with shared organization accounts and separate tools for day-to-day operations. The current codebase includes two main business products:

Check Printing: prepare, review, approve, and print business checks; manage payees, bank accounts, print settings, and check history.

Time and Attendance: let employees record work attendance and let managers manage employee records, review attendance, and view reports.

Both products are designed for organizations with one or more workspaces or locations. A company can give employees different access based on their role and responsibilities.

2. Main users

User | Typical tasks

Organization owner or administrator | Set up the organization and workspaces, invite or manage members, assign access, and configure product settings.

Finance team member | Maintain payees and bank details, prepare checks, and review check records. Specific permissions determine whether they can approve or print.

Approver | Review checks requiring approval and approve or reject them according to the organization’s rules.

Employee | Use the attendance experience to clock in or out and review their own attendance information.

Attendance manager | Manage employee and location details, review attendance records, and export reports.

Access is permission-based. For example, creating a check, approving it, and printing it can be assigned to different people.

3. How a user gets access

An organization is registered, or an authorized user signs in to an existing organization.

The system verifies the user’s credentials and starts a secure session.

The user selects or enters the organization they are working in. The system checks their organization membership and whether the relevant product is available to that organization.

For workspace-specific work, the system also checks that the user belongs to that workspace and has the required permission.

The user sees the screens and actions allowed by their access level.

This shared account foundation avoids maintaining unrelated logins for each product while keeping organization and workspace records scoped to the right business.

4. Check Printing: typical workflow

Set up the workspace: an administrator configures workspace details, check layout and printing preferences, and authorized bank accounts.

Set up payees: a permitted user adds or updates vendors and other recipients.

Prepare a check: a finance user selects the payee and bank account, enters the amount and other check details, and saves the check.

Review and approve: when approval rules apply, designated approvers review the check and approve or reject it. Approval permissions can be separated from check creation and printing.

Print: an authorized user generates the check output and prints it using the configured layout and printer settings. The system includes print calibration and print-batch support.

Track the record: users with access can review check status, register information, and history. Changes and important actions are recorded for traceability.

Bank account details are protected in storage and masked in normal application responses. Full account numbers are not displayed in routine screens or API responses.

5. Time and Attendance: typical workflow

Configure the organization: a manager maintains employee profiles, workspaces or work locations, attendance settings, and schedule information.

Employee clocks in or out: the employee uses the attendance web application, which can request the device's location and camera access.

Location check: when geofencing is configured, the system compares the reported location with the workspace's allowed area. The result can be used to identify an on-site, late, or out-of-area punch according to configured rules.

Identity check: the attendance service can compare a live camera capture with the employee's stored reference photo and run liveness checks before accepting a punch.

Manager reviews attendance: authorized managers can review records and summaries, filter by employee, date, or status, and export reports.

Location and camera checks depend on device permissions, network availability, and the organization's configured policies. The facial liveness checks are software-based safeguards; they should not be treated as certified identity proof or as a guarantee against every spoofing attempt.

6. How the parts work together

Employee or administrator | v Web application | v Sign-in and access checks | +----+----+ | | v v Check Printing Time & Attendance | | +----+----+ v Shared business data store

The web applications send requests to their corresponding services. Those services validate requests, check identity and permissions, apply the business rules, and read or update the shared PostgreSQL data store. The applications are separate so that check processing and attendance can evolve independently while using a common organization and access foundation.

7. Data protection and accountability

Organization separation: business records are associated with an organization and, where applicable, a workspace. Access checks are applied before users can work with protected records.

Role-based access: permissions control sensitive actions such as managing bank accounts, approving checks, printing checks, or managing members.

Secure sign-in: passwords are stored as protected password hashes. Sessions use short-lived access credentials with refresh handling.

Financial data: bank routing and account information is encrypted in storage and masked in ordinary responses.

Activity history: important business changes and approval transitions are designed to create audit records, supporting later review.

Input and service protections: application services validate incoming data and apply request limits and centralized error handling.

These controls describe the application design. Production security also depends on deployment configuration, access administration, backups, network controls, and operational procedures.

8. Included components and current scope

The repository contains the organization sign-in service, a check-printing web portal and backend, and an attendance web application and backend. It also contains a facial-verification service used by the attendance flow.

There is a separate retrieval-based chatbot project that can answer from content supplied to it. It is an optional supporting component and is not required for the check-printing or attendance workflows. A separate AI Studio portal is marked as a prototype. The portal website README is still template text, so any broader customer self-service or public website capabilities should be confirmed against the agreed delivery scope.

The source code describes application capabilities; it does not by itself confirm that every component has been deployed, connected to production services, or configured for a particular client. Final workflows, subscription terms, attendance policies, check approval thresholds, printer hardware, email/SMS providers, hosting, backups, and data-retention periods should be agreed during implementation and onboarding.

9. Typical onboarding sequence

Confirm the client’s organization structure, locations, users, and responsibilities.

Agree which products and workflows are in scope.

Configure the organization, workspaces, roles, and permissions.

For check printing, configure bank accounts, payees, approval rules, check design, and printer calibration.

For attendance, configure employees, locations, schedules, geofence boundaries, and camera/location policies.

Train administrators, finance users, approvers, managers, and employees.

Validate the agreed workflows in the client’s environment before operational use.

10. Client decisions to confirm

Which products and workspaces are included in the client’s rollout?

Who may create, approve, void, and print checks, and what approval thresholds apply?

Which employees and locations will use attendance, and what are the allowed location and grace-period rules?

Is camera-based attendance verification required, and what notice, consent, and retention policies will apply?

Which check printer models and paper/check stock need calibration?

What hosting region, backup schedule, retention period, and support process are required?

Should the optional chatbot be configured with the client’s approved help content?

This overview is intended to support client discussion. Final scope, policies, integrations, service levels, and deployment commitments should be documented in the project agreement and implementation plan.

PART 2 — CLOCK IN / CLOCK OUT USER MANUAL

Source: CLOCK_IN_CLOCK_OUT_SYSTEM_DOCUMENTATION.docx

Clock In / Clock Out

User Manual

Audience: Employees, managers, and organization administrators

Prepared: 23 October 2026

Purpose: Step-by-step guidance for using the Clock In / Clock Out system.

1. Welcome

Clock In / Clock Out helps your organization keep employee, work location, shift, and attendance information together. Employees use it to record when they start and finish work. Managers use it to maintain employee details and schedules, check attendance, and prepare reports.

The system can use the device's location and, when enabled for your organization, a camera photo to support an attendance entry. Your organization decides which locations, schedules, access roles, and verification rules apply.

2. Who should use this manual

If you are a… | Start with…

Employee | Sections 4, 5, and 8.

Manager or administrator | Sections 3, 6, 7, and 8.

Organization owner | All sections, especially setup and launch checks in Sections 3 and 9.

Your access depends on your role

- Owners manage the organization and can manage administrator access.
- Administrators and managers manage work locations, employee records, schedules, settings, and attendance reports according to their assigned access.
- Employees record attendance and review their own information using the employee app provided by their organization.

The browser-based console is intended for administrators and managers. In the current sign-in flow, employees are directed to the SmartBusiness mobile app. Ask your administrator which employee app and sign-in details your organization uses.

3. Getting started as an administrator

3.1 Sign in

1. Open the Clock In / Clock Out web console provided by your organization.
2. Enter your work email and password.
3. If your account belongs to more than one organization, choose the organization you need.
4. Choose the correct work location (also called a workspace or site) before making changes or reviewing location-specific information.

If you cannot sign in, check that you are using your organization account. Use the password reset option if it is available, or contact your organization's system administrator.

3.2 Choose a work location

Organizations may have several offices, branches, or job sites. Select the location you are working with before adding employees, setting location details, or reviewing a location-specific report. Check the selected location name when switching between sites so you do not update the wrong one.

3.3 Set up employee records

Use the employee management area to add, view, update, or deactivate employee records. Depending on the information your organization collects, an employee record may include:

- Name and work email.
- Employee number, department, and job title.
- Phone or other contact details.
- Assigned work location.
- Weekly work schedule and shift times.
- A profile photo, if your organization uses photo-based attendance verification.

To add an employee, open the employee list, choose the add-employee action, enter the required details, assign the employee to a location, and save. Review the employee list afterward to confirm the new record appears correctly.

To update an employee, open their record, make the required changes, and save. If an employee leaves or should no longer use the system, follow your organization's offboarding process. Contact the owner if you need administrator

access; only an organization owner can create another administrator account in the current system rules.

3.4 Set employee schedules

Schedules help the system compare an employee's first arrival with the expected shift start. When setting a schedule:

1. Open the employee's record.
2. Select the appropriate work location and working days.
3. Enter the expected start and end times for each working day.
4. Mark non-working days correctly.
5. Save, then review the schedule for accuracy.

The setup may offer a standard Monday-to-Friday schedule as a starting point. Check every employee's actual work pattern, including part-time, rotating, or weekend schedules, before relying on attendance summaries.

4. Setting up a work location and attendance rules

Administrators can configure a work location's map position, allowed distance, standard shift times, and late-arrival grace period.

4.1 Configure the location

1. Open organization or location settings.
2. Select the work location to configure.
3. Confirm the location name and address.
4. Set the map position for the site.
5. Set the allowed distance around that position (the geofence radius).
6. Set the default shift start and end times and the grace period, if used.
7. Save the settings and review them with a test employee account.

Use coordinates that represent the actual employee entrance or work area. Location accuracy varies by device, building, and network conditions. If the site has multiple buildings or a large outdoor area, agree on an appropriate radius with your organization before launch.

4.2 Understand the attendance rules

- An employee's first clock-in of the day is compared with the scheduled start and grace period to determine whether it is on time or late.
- Additional work sessions on the same day are recorded as separate sessions.
- Work duration is calculated from clock-in and clock-out times.
- Depending on your organization's configured policy, short shifts may be marked as a half day or absent, and a session may be marked as automatically closed.

Confirm the organization's rules for breaks, overtime, overnight shifts, public holidays, multiple sessions, missed punches, and time zones. Do not use attendance totals for payroll until the organization has reviewed and approved these rules.

5. Recording attendance as an employee

Use the employee app your organization has provided. The steps below describe the expected process; the exact screens may differ by app version.

5.1 Clock in

1. Sign in to the employee app.
2. Confirm that the correct organization and work location are selected.
3. Allow location access when prompted if your organization uses location checks.

4. Allow camera access and follow the on-screen photo instructions if your organization requires photo verification.
5. Choose Clock In or the equivalent action and wait for the confirmation.
6. Check that the app shows an active shift and the correct clock-in time.

Avoid tapping the clock-in action repeatedly. If the app reports that a shift is already open, check your current attendance status or contact your manager.

5.2 Clock out

1. Open the active shift in the employee app.
2. Choose Clock Out or the equivalent action.
3. Wait for the confirmation and check that an end time appears.
4. Review the displayed hours if the app shows them.

The system does not allow a normal clock-out if it cannot find an open shift. If you forgot to clock in, clocked in by mistake, or see an incorrect time, contact your manager and follow your organization’s correction process.

5.3 Location and photo checks

Keep location services enabled and use the app outdoors or near a window if the location cannot be found. Make sure your face is visible and the area is well lit when the app requests a photo. If verification does not work, retry once in better lighting and contact your manager if the problem continues.

Your organization should tell you when location or photo information is collected, why it is used, who can view it, and how long it is kept.

6. Reviewing attendance and reports as a manager

6.1 Dashboard

The administrator dashboard provides a summary of attendance information, such as employee counts, current-day attendance, late arrivals, attendance rates, and trends where available. Use it as an overview, then open the detailed report to investigate a particular employee, date, or location.

6.2 Attendance report

1. Open the attendance report or attendance ledger.
2. Select the date or date range.
3. Select a work location if you want to limit the report to one site.
4. Search for an employee or filter by attendance status as needed.
5. Review the clock-in time, clock-out time, hours, notes, and any available session details.
6. If you need a file, choose the export action and select one of the available formats.

Exports may contain employee names, attendance times, location details, and other personal information. Save them only in organization-approved locations and share them only with people who are authorized to see them.

6.3 Attendance statuses

The exact policy is controlled by your organization. Common status meanings are:

Status | General meaning

Present | Attendance was recorded as on time under the applicable schedule and grace period.

Late | The first arrival was after the applicable start-time grace period.

Half day | Recorded work time fell below the organization’s full-shift expectation.

Absent | The attendance record or work duration was treated as an absence under the configured rules.

Auto-closed | The session was closed automatically according to the system’s configured process. Ask your administrator how and when this occurs.

Review exceptions with the employee before using a report for payroll or disciplinary decisions. A status is a record produced by the configured rules; it does not replace manager review.

7. Employee profile and personal attendance history

The employee experience may provide a personal profile, attendance history, and a dashboard showing recent activity or monthly totals. Check that the profile information and assigned location are correct. Tell your manager if your name, schedule, location, or profile photo needs updating.

If a day or punch is missing, do not create a duplicate entry unless your manager instructs you to do so. Contact your manager with the date, approximate time, and location so the organization can review the record.

8. Common issues and what to do

Issue | Suggested action

Sign-in does not work | Check your work email, verify the organization selected, reset your password if available, or contact the administrator.

The wrong location is shown | Switch to the correct location before continuing. Tell your manager if the location is missing.

Location cannot be detected | Enable location services, check the app’s location permission, move to an area with a clearer signal, and retry.

Camera or photo check does not work | Check camera permission, clean the camera lens, improve lighting, and follow the live capture prompts. Contact the administrator if it continues.

App says you are already clocked in | Check the active-shift view. If you are not working an active shift, contact your manager to review the open record.

Clock-out says there is no active shift | Confirm the correct account and location. Contact your manager to report the missing clock-in.

Hours or status look incorrect | Compare the displayed times with your schedule and notify your manager. The organization’s correction process should be used for changes.

Report is empty or incomplete | Check the date range, selected location, and filters. Ask an administrator to confirm the employee is active and assigned to that location.

Export does not download | Retry the export, check browser download permissions, or ask an administrator for help.

9. Important notes for organization owners

Before relying on the system operationally, confirm the following with your implementation or support team:

- Employees know which app to use and how to sign in.
- Each employee is assigned to the correct location and schedule.
- Location boundaries, start times, and grace periods have been checked at each site.
- The organization has decided whether a punch outside the location boundary should be accepted, flagged, or blocked.
- The organization has decided whether a punch may be recorded when a camera or face check is unavailable or unsuccessful.
- Staff have been told how attendance photos and location information are used and retained.
- Managers know how to review missed punches and correct errors through the agreed process.
- Report statuses and hours have been validated against the organization’s payroll and attendance policy.
- An authorized contact is available to help employees who cannot access the app.

Location and face verification can support an attendance process, but devices and software may produce inaccurate or incomplete results. The current implementation can record a punch even when a location or face check is outside the expected result or unavailable. If your organization requires these checks to block a punch, have the implementation team confirm that policy is enforced before launch.

10. Privacy and responsible use

- Use your own account and do not share your password.
- Do not try to clock in or out for another employee.
- Keep your device’s location and camera permissions limited to what your organization requires.
- Treat attendance reports and exported files as confidential employee information.
- Ask your manager how to request a correction or raise a concern about collected data.

11. Quick reference

Employee: Sign in → confirm location → follow any location/photo prompt → clock in → clock out at the end of work → review history.

Manager: Select location → maintain employee records and schedules → review dashboard and attendance report → investigate exceptions → export only when needed.

Owner: Confirm access, locations, schedules, verification policy, privacy notice, and support process before organization-wide use.

This manual describes the Clock In / Clock Out user experience represented in the current project. Some employee-facing screens depend on the mobile app supplied by the organization. Your organization’s published attendance policy and the deployed configuration determine the final rules.
